

Developer Resources

These are resources for developers of QuickFIX/J, not the developers who *use* the tool.

SourceForge Project Site

Error rendering macro 'rss' : javax.net.ssl.SSLHandshakeException: sun.security.validator.ValidatorException: PKIX path building failed: sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid certification path to requested target

Source Code

Source code is available from the SourceForge Subversion repository. Information on accessing the repository can be found [here](#). You can also browse the [Subversion repository](#).

As the SourceForge Subversion documentation states, you'll generally want to checkout the trunk rather than the root of the repository.

```
svn co https://quickfixj.svn.sourceforge.net/svnroot/quickfixj/trunk
quickfixj
```

Jira Issue Tracking

Jira is used for issue/bug tracking and release management. It can be found [here](#).

Build Server

QFJ uses the [Bamboo](#) CI server. Latest build status is [here](#). RSS feeds are also available on the build status page.

Coding conventions

SVN commit comment

When committing in SVN, the developer must follow this pattern in the comment:

```
QFJ-nnn: <title of JIRA ticket>
<comments>
```
